Visual Evidence

One observed moment

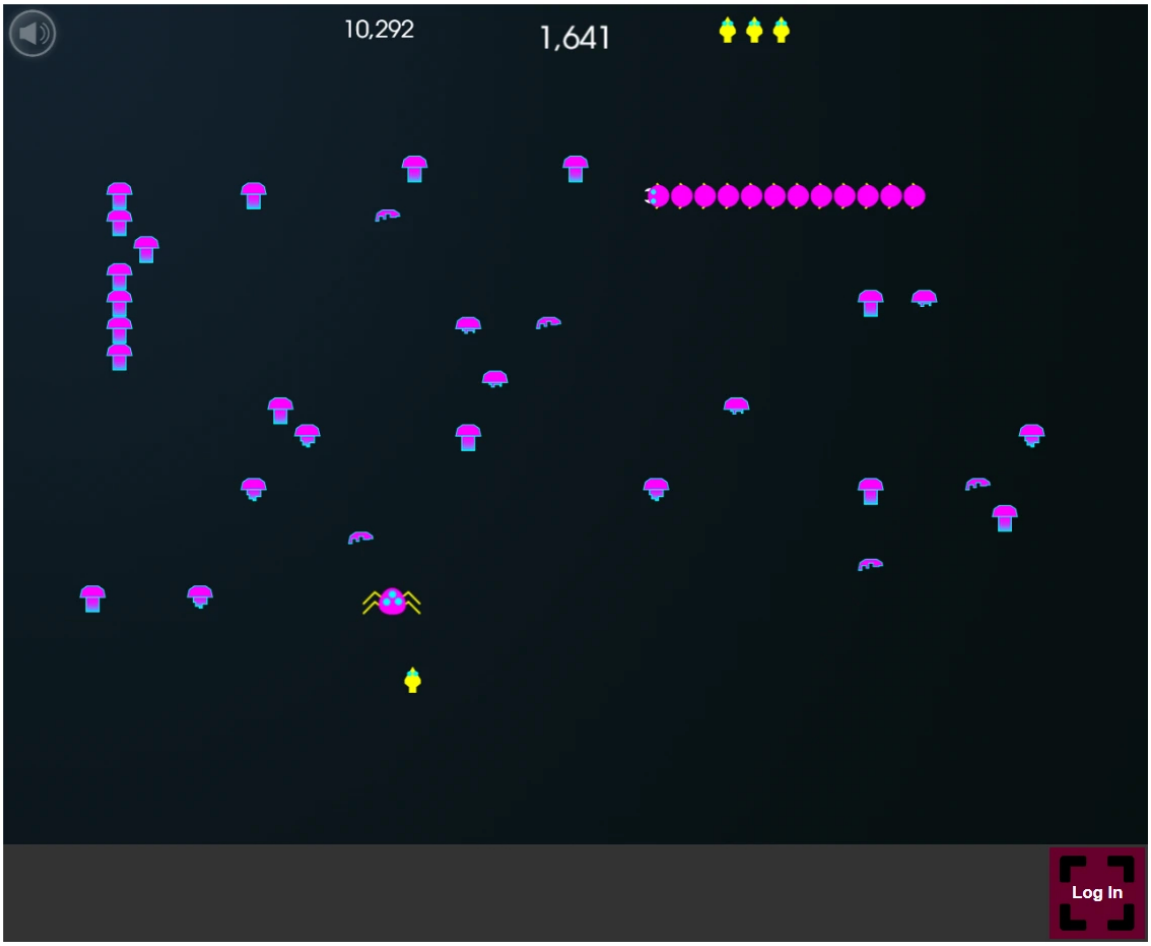

Image evidence prompt

Submit one original screenshot or still of your Case Study 1 Atari game. Caption it with the title, version or platform when known, the scene shown, and its source. A relevant image from your first case study may be reused.

Requirements and potential deductions

- The image shows the original scene used for this redesign. (up to -0.5 points)
- The caption identifies the selected Atari game, scene, and image source. (up to -0.5 points)

Caption: Centipede (1981), AARP browser version. Original gameplay scene showing the centipede near the top, mushrooms throughout the playfield, a spider and player shooter near the bottom, and the score and lives indicators. Source: https://games.aarp.org/games/atari-centipede

Visual Redesign

Improvement goal

Response prompt

Identify one visual problem in the original scene and explain the mood or player experience your redesign should support. Refer to a specific detail in the original image.

Requirements and potential deductions

- Identifies a visual problem using a specific detail from the original scene. (up to -0.75 points)
- Explains the intended mood or player experience of the redesign. (up to -0.75 points)

Submitted response

The original Centipede scene uses a dark background with bright magenta and cyan outlines across the centipede, mushroom other insects. Although these colors make the objects visible, the similar neon colors make the playfield feel visually busy. I wa improve the game's ambience, which Chapter 6 discusses as part of a game's overall look and feel. My redesign uses a blue-t background for the playfield and a darker navy background for the HUD, creating a clearer separation between gameplay and interface information. Orange mushrooms and centipede segments, a purple spider, and a mint-green player shooter make the different elements easier to distinguish. My goal was to create a more cohesive and polished appearance while preserving the original gameplay.

Revised palette

Response prompt

List your proposed colors and their roles, including any neutrals. Explain why this palette size and a named color relationship suit your improvement goal, and how contrast makes an important element stand out. Color names or swatches are sufficient; exact color codes are optional.

Requirements and potential deductions

- Identifies the proposed colors and what each is used for. (up to -0.5 points)
- Justifies the palette size and a named color relationship using the improvement goal. (up to -0.75 points)
- Explains a contrast choice that makes an important element stand out. (up to -0.75 points)

Submitted response

My redesign uses seven colors, each with a specific role. Navy is used for the HUD background, while blue-teal fills the playfie separating the interface from the gameplay area. Orange is used for the centipede and mushroom caps, purple identifies the s and mint green identifies the player shooter and remaining lives icons. Warm ivory is used for text, mushroom stems, and centi details, while teal outlines the HUD and adds details to the spider. The palette uses a complementary relationship between blu orange, allowing the warm gameplay elements to stand out against the cool backgrounds. The dark navy HUD and ivory text a create contrast that helps the score and lives information remain readable. Although seven colors are used, each has a distinct purpose, creating a consistent visual style without making every element look the same.

Redesigned scene

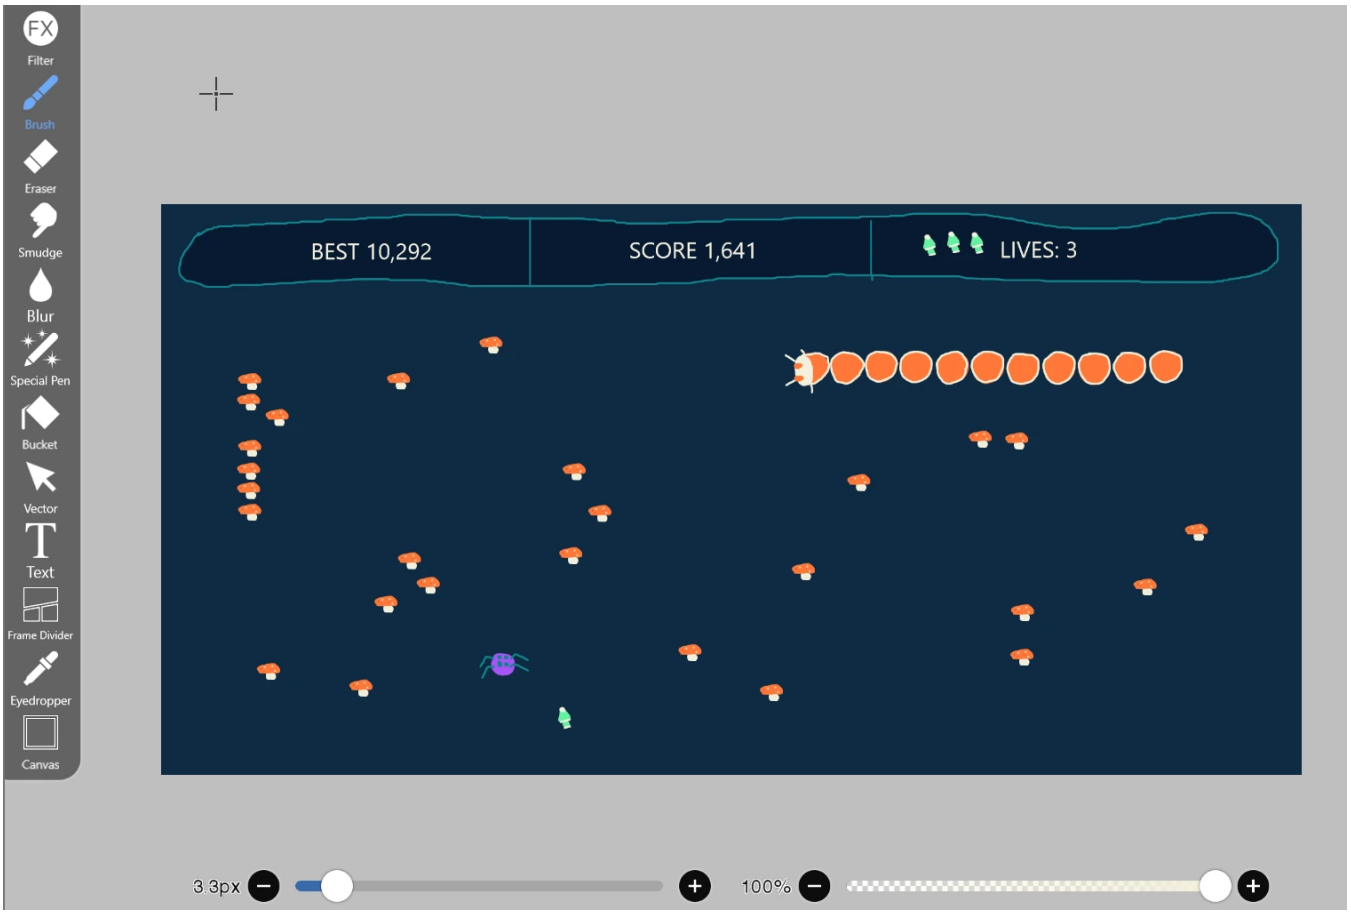

Image evidence prompt

Submit a colored sketch, annotated recoloring, or mockup of the same scene using your proposed palette. Include a gameplay element and an interface or state indicator. Keep an important state understandable without color alone, using a label, shape, or icon. Caption the image to identify the scene and your changes.

Requirements and potential deductions

- The redesign applies the proposed palette to the same scene's gameplay element and interface or state indicator. (up to -1.25 points)
- An important state has an understandable label, shape, or icon in addition to its color. (up to -1.25 points)

Caption: Redesigned gameplay scene based on the AARP browser version. The redesign uses a navy HUD, blue-teal playfield, orange centipede and mushrooms, purple spider with teal details, mint-green player and lives icons, and warm ivory text and sprite details. The HUD includes separate sections for the best score, current score, and lives. The original gameplay elements and their arrangement are retained while the visual presentation is updated.

Look and feel decision

Response prompt

Explain one visual change beyond the palette, such as composition, interface layout, character shape, or an animation you would add. Connect it to a relevant Chapter 6 concept from vision, interface, ambience, or storytelling and explain its intended effect on the player. Describe motion in words if your sketch cannot show it.

Requirements and potential deductions

- Connects a specific visual change beyond the palette to a relevant Chapter 6 concept. (up to -0.75 points)
- Explains how that change would affect the player's experience. (up to -0.75 points)

Submitted response

Beyond recoloring the sprites, I changed the interface by placing the best score, current score, and remaining lives inside a lon outlined HUD at the top of the screen. The navy HUD background separates this information from the blue-teal playfield, while borders and dividers organize the three sections. This connects to Chapter 6's discussion of interface design because the inter should communicate useful information without distracting players from the game. I also used ivory text and separate shooter-s icons for the lives indicator, making the information easier to read and count. The spider's teal details visually connect it to the outline, helping establish a consistent look and feel. These changes are intended to make the game feel more organized while keeping the player's attention on the action.

Evaluate the redesign

Response prompt

Compare your redesign with the original scene. Explain how the revised visuals work together to address your improvement goal while keeping the game's core actions and rules. Refer to a specific difference visible in the two images.

Requirements and potential deductions

- Evaluates the combined effect of the revised visuals on the improvement goal using a specific before-and-after difference. (up to -0.75 points)
- Explains how the original core actions and rules remain intact. (up to -0.75 points)

Submitted response

Compared with the original screenshot, my redesign replaces the dark background and neon magenta and cyan outlines with a blue-teal playfield, a navy HUD, and distinct colors for each gameplay element. The orange centipede and mushrooms contras the cool background, while the purple spider and mint-green player shooter are easier to distinguish. The ivory text stands out i the navy HUD, and the teal outline and dividers separate the best score, current score, and lives indicator from the playfield. Th changes improve the overall ambience by making the scene more cohesive and support the interface by organized important information. The core gameplay remains unchanged: the player still shoots at the centipede and other insects, moves through t mushroom-filled playfield, and monitors the score and remaining lives. The redesign changes the visual presentation rather tha original mechanics or rules.
